## I. INTRODUCTION AND RESEARCH QUESTION

The turnout rate is influenced by many factors that may be related to age, race/ethnicity, gender, socio-economic status and political/economical situation of the country. In this broad spectrum of variables that influence participation of voters in elections, this article will focus specifically on whether youth unemployment has an impact on turnout in the case of Spain. Youth unemployment has been a pressing issue in the country for a long time now since the period of time 2000-2016, youth unemployment (unemployed youth from 16 to 24 years old) had never been lower than 17.5% (Source: Eurostat).

We are also interested to see if youth unemployment mobilize voters with more intensity in regions where there is more young people. If this is the case, this effect can come from three different sources: because older people feel the responsibility to vote more given the amount of young people unemployed, because young people go to vote more or because of a combination of the two factors above.

This case study is interesting for the recent change in the political system of the country, that went from a party system traditionally dominated by the PP (center-right) and the PSOE (center-left) to a multi party system where the Podemos (left) and Ciudadanos (liberal/center-right) reached the national parliament with a significant vote share in the recent national elections. Our guess is that, since youth unemployment rates in Spain was significantly high in recent years as a result of the euro crisis reaching 48.1% in 2015 (Source: Eurostat), young voters turnout or other kind of voters influenced by their feeling of responsibility towards young people were among the reasons to explain why the party system changed so drastically in recent years.

## II. LITERATURE REVIEW:

Literature on voter behavior tend to rely mainly on the incumbency-oriented hypothesis, which claims that voters tend to reward or punish government in elections according to the economic performance of the country (CHANGE Dassonneville and Lewis-Beck (2013)). In that sense, objective or subjective economic indicators such as unemployment rates, inflation, growth and other related aspects have the potential to explain part of the variance in government support (Lewis-Beck and Stegmaier (2000)). Citizen dissatisfaction with economic performance substantially increases the possibility to vote against the incumbent. While some authors believe that the state of employment does not have a detectable effect upon voting behavior (Stigler (1973)), others have reasons to believe that unemployment rates play a role depending on the political identification of the incumbent party, with left-wing governments suffering more from high unemployment rates than right-wing governments (Dassonneville and Lewis-Beck (2013)).

Another study goes beyond this polarization of the effect of unemployment on turnout by pointing out that individuals perceive job loss as a personal problem when the unemployment rate is low and a social problem when the unemployment rate is high. Therefore, job loss is a mobilizing experience when the unemployment rate is high. In particular, “unemployed Americans’ political behavior is meaningfully influenced by unemployment context to an extent that we do not observe among gainfully employed Americans” (Incantalupo (2011)). This finding is particularly interesting in the context of our research. Although our study focuses on the Spanish case, we do not expect this kind of behavior to be completely different than the U.S case and this could mean that young unemployed, in a high unemployment context, would show higher turnout in the election day affecting the political outcome.

Data from the Spanish Center of Sociological Research collected before the general elections in the Spring of 2011, shows that 40.6% of the Spanish young people (15 to 29 years old) felt distrust regarding politics. It is relevant to mention that a few weeks after the general election occurred in 2011, the 15-M movement started. This movement was a “response to the inability of institutional politics to deal with the problems the country

had been facing since 2009” and that speed up the appearance of new political parties into the National scene such as Podemos or Ciudadanos. In this context, Jover, Montoro, and Guio (2014) argues that the previous distrust feeling would make young Spanish voters to not to participate in the general elections of 2011. Hence, after the 15-M and with the appearance of new political options, the youth would mobilize and vote more in subsequent elections. In fact, 41.8% of the young people answered in a survey that the 15-M movement had influenced them a lot to cast their vote in the regional elections in the Fall of 2011, months after the General Elections. It is important to mention that Jover, Montoro, and Guio (2014) shows data from self-reported surveys and does not prove causality between youth unemployment and turnout or between the appearance of new political parties and turnout.

### III. STATISTICAL MODEL AND HYPOTHESIS

Our theory is that turnout is positively impacted by higher youth unemployment rates and even going further, that the effect of youth unemployment on turnout depends positively on the amount of young people. In that sense, we aim to reject the following hypotheses:

$H_0$  = there is no relation between youth unemployment and turnout.  $H_1$  = the amount of young people able to vote in a given region does not affect the relationship between youth unemployment and turnout.

In order to analyze this relation statistically, we propose the following model:

$$Turnout_{i,t} = \beta_0 + \beta_1 Youth\ Unemployment_{i,t} + \beta_2 \%Young\ People + \beta_3 Youth\ Unemployment * \%Young\ People + \delta_i + u_{i,t}$$

where  $i$  represents each of the 17 regions (Autonomous Communities) of Spain,  $t$  represent the most recent years where general elections were held: 2004, 2008, 2011 and 2015 and  $\delta_i$  represents regional fixed effects.

Our model will be tested using data from the Spanish Statistic Office (INE) and the Electoral Results from the Spanish Ministry of Interior Affairs (MI) in the different regions of the country.
